Objectives

1. To develop a menu-driven Hospital Patient Management System for maintaining patient records efficiently.
2. To store patient details such as patient ID, name, age, disease, and allotted bed number in a doubly linked list.
3. To perform essential operations such as admitting new patients, searching for patient records, discharging patients, and displaying records.
4. To display patient information in both forward and backward directions using the doubly linked list.
5. To use an array for managing hospital bed allocation and helping track available beds.
6. To use a stack to store discharged patient details and support undoing the most recent discharge.
7. To apply dynamic memory allocation and linked-list operations for flexible record management.
8. To improve accuracy, accessibility, and organization of patient information while reducing manual record-handling effort.
